

That's a good approach. Instead of showing a long list of plants, your AI can act like a **Plant Recommendation Assistant** and ask questions based on the user's intent.

Step 1: First Question

Who is this plant for?

- Buy for Myself
 - Gift to Someone
-

Flow 1: Gift Plant Recommendation

If the user selects **Gift to Someone**, ask:

1. Whom do you want to gift?

- Friend
 - Mother
 - Father
 - Sister
 - Brother
 - Spouse
 - Colleague
 - Teacher
 - Other
-

2. Occasion

- Birthday
 - Anniversary
 - Housewarming
 - Wedding
 - Graduation
 - Festival
 - Thank You
 - Get Well Soon
 - Just Because
-

3. Purpose of Gift

What message do you want your gift to convey?

- Good Luck
 - Love & Affection
 - Friendship
 - Prosperity
 - Positive Energy
 - Health & Wellness
 - Decoration
 - Low Maintenance
-

4. Location

Where will the recipient keep the plant?

- Bedroom
 - Living Room
 - Balcony
 - Office Desk
 - Garden
 - Kitchen
 - Terrace
-

5. Light Availability

How much sunlight is available?

- Low
 - Medium
 - Bright Indirect
 - Direct Sunlight
-

Example Recommendation

Input

- Friend
- Birthday
- Friendship
- Bedroom
- Low Light

AI Output

Recommended Plants

1. Snake Plant 🌿

Reason:

Easy to maintain, grows well in low light, and symbolizes positivity and growth.

2. ZZ Plant 🌿

Reason:

Beautiful indoor plant with low maintenance.

3. Money Plant 🌿

Reason:

Represents prosperity and friendship.

Flow 2: Buy for Myself 🌿

Ask:

1. Purpose

Why do you want a plant?

- Home Decoration
 - Air Purification
 - Gardening Hobby
 - Office Desk
 - Good Luck
 - Stress Relief
 - Medicinal Use
 - Balcony Beautification
-

2. Where will you place it?

- Bedroom
- Living Room
- Balcony
- Office Desk

- Garden
 - Kitchen
 - Terrace
-

3. Light Availability

- Low Light
 - Medium Light
 - Bright Indirect Light
 - Direct Sunlight
-

4. Season

Current Season

- Summer
- Monsoon
- Winter
- All Season

You can automatically detect season from date/location, but giving manual selection is also fine.

5. Maintenance Level

How much care can you provide?

- Low
 - Medium
 - High
-

Example Recommendation

Input

- Air Purification
- Bedroom
- Low Light
- Monsoon
- Low Maintenance

AI Output

Recommended Plants

1. Snake Plant

Why?

- ✓ Removes indoor toxins
 - ✓ Requires less water
 - ✓ Thrives in low light
 - ✓ Beginner friendly
-

2. Peace Lily

Why?

- ✓ Purifies air
 - ✓ Beautiful flowers
 - ✓ Ideal for bedrooms
-

3. Spider Plant

Why?

- ✓ Non-toxic
 - ✓ Easy to grow
 - ✓ Improves indoor air quality
-

Recommendation Logic

You can assign tags to each plant.

Example:

Plant	Purpose	Light	Location	Maintenance	Gift Occasion
Snake Plant	Air Purification	Low	Bedroom	Low	Birthday
Money Plant	Prosperity	Medium	Living Room	Low	Housewarming

Peace Lily	Decoration	Low	Bedroom	Medium	Anniversary
Rose	Love	High	Balcony	Medium	Anniversary
Tulsi	Medicinal	High	Balcony	Low	Festival

Then:

1. Collect user answers.
 2. Match tags with plants.
 3. Rank plants by number of matching tags.
 4. Show top 3–5 recommendations with reasons.
-

One More Feature

After showing recommendations:

Did you like any plant?

[Buy Now]

[Gift This Plant]

[Save to Wishlist]

[Ask AI More Questions]

This creates a seamless flow from **AI recommendation** → **Purchase/Gift**, which is likely to increase conversions in your app.

Since you are currently focusing on **Gift Plant**, **Purchase Plant**, and **Suggest Plant**, keep the scope small and make these flows smooth.

1. Purchase Plant

User Flow

Home

↓
Order Confirmation

Plant Details Page

Display:

- Plant Image
- Plant Name
- Price
- Category
- Description
- Sunlight requirement
- Water requirement
- Difficulty level
- Height
- Pot size
- Stock availability

Database Tables

Plants

Field	Type
plant_id	Integer
name	String
category	String
description	Text
price	Decimal
stock	Integer
sunlight	String
water_frequency	String
image_url	String

Orders

Field	Type
order_id	Integer
user_id	Integer
total_amount	Decimal
status	String
order_date	Date

Order_Items

Field	Type
order_item_id	Integer
order_id	Integer
plant_id	Integer
quantity	Integer
price	Decimal

2. Gift Plant 🎁

This is almost the same as Purchase, but with recipient details.

User Flow

Gift Form

Collect:

Recipient Details

- Name
- Mobile Number
- Email (optional)
- Address

Gift Details

- Personal Message
- Delivery Date
- Gift Wrap (Yes/No)

Example:

To : Rahul

Message :

Happy Birthday!
Hope this plant grows along with our friendship 🌱

Gift Table

Field	Type
gift_id	Integer
sender_id	Integer
recipient_name	String
recipient_mobile	String
recipient_addresses	Text
plant_id	Integer
message	Text
delivery_date	Date
status	String

3. Suggest Plant to User

This feature can increase sales significantly.

Option 1: Share Existing Plant

User likes a plant.

Clicks:

Suggest to Friend

Share options:

- WhatsApp
- SMS
- Email
- Copy Link

Example message:

Hey!

I found this beautiful Snake Plant 

It is easy to maintain and perfect for indoor spaces.

Check it here:

<plant link>

Option 2: AI Recommendation

Ask simple questions:

Where will you keep the plant?

- Bedroom
- Balcony
- Living Room
- Office

How much sunlight is available?

- Low
- Medium
- High

How much time can you spend caring?

- Low
- Medium
- High

Then recommend:

Recommended Plants

1. Snake Plant

Reason:

Low maintenance and grows in low light.

2. ZZ Plant

Reason:

Needs less water and survives indoors.

3. Money Plant

Reason:

Fast growing and beginner friendly.

Snake Plant

₹399

[Buy] [Gift] [Suggest]

Money Plant

₹249

[Buy] [Gift] [Suggest]

One Small Improvement

On the **Plant Details** page, place all three buttons together:

[Buy Now]

[Gift This Plant]

[Suggest to Friend]

This keeps the user on the same page and increases the chances that they use multiple features instead of navigating elsewhere.

For a college mini-project or hackathon, these three modules plus your future AI chatbot and Plant Cards will make a very strong end-to-end application.

For your application, you **do not need a complex ML model initially**. Since you already have a list of plants in your shop, a **rule-based recommendation engine** is the best approach.

Step 1: Store Plant Information

Create a table containing all plants available in your shop.

Plants Table

Field	Example
plant_id	1
name	Snake Plant
price	399

purpose	Air Purification, Decoration
location	Bedroom, Living Room, Office
light	Low, Medium
season	All
maintenance	Low
gift_for	Friend, Colleague
occasion	Birthday, Housewarming
image	snake.jpg

Example Data

Plant	Purpose	Location	Light	Season	Maintenance	Gift For	Occasion
Snake Plant	Air Purification	Bedroom	Low	All	Low	Friend	Birthday
Money Plant	Prosperity	Living Room	Medium	All	Low	Friend	Housewarming
Peace Lily	Decoration	Bedroom	Low	All	Medium	Mother	Anniversary
Rose	Decoration	Balcony	High	Winter	Medium	Spouse	Anniversary
Tulsi	Medicinal	Balcony	High	All	Low	Mother	Festival

Step 2: User Selects Recommendation Type

First ask:

Who is this plant for?

- Buy for Myself

- Gift to Someone

Save this answer.

Step 3: Ask Dynamic Questions

Case 1: Buy for Myself

Ask:

Purpose?

Air Purification

Decoration

Stress Relief

Office Desk

Good Luck

Medicinal

Then:

Where will you place it?

Bedroom

Living Room

Balcony

Office Desk

Garden

Kitchen

Then:

Light Available?

Low

Medium

Bright Indirect

Direct Sunlight

Then:

Season?

Summer

Monsoon

Winter

All Season

Then:

Maintenance Level?

Low

Medium

High

Case 2: Gift

Ask:

Whom do you want to gift?

Friend

Mother

Father

Sister

Brother

Spouse

Teacher

Colleague

Then:

Occasion?

Birthday

Anniversary

Wedding

Housewarming

Festival

Graduation

Then:

Purpose?

Friendship
Love
Prosperity
Positive Energy
Decoration
Good Luck

Then:

Where will recipient keep it?

Bedroom
Living Room
Balcony
Office
Garden

Then:

Light Availability?

Low
Medium
Bright Indirect
Direct Sunlight

Step 4: Filter Plants

Suppose user chooses:

Buy for Myself

Purpose = Air Purification

Location = Bedroom

Light = Low

Season = All

Maintenance = Low

Query

Filter:

```
SELECT *  
FROM Plants  
WHERE purpose LIKE '%Air Purification%'  
AND location LIKE '%Bedroom%'  
AND light LIKE '%Low%'  
AND season LIKE '%All%'  
AND maintenance='Low';
```

Result:

Snake Plant

Peace Lily

Spider Plant

Step 5: Ranking System

Sometimes multiple plants match.

Give score to each plant.

Example:

Condition	Score
Purpose matched	+5
Location matched	+3

Light matched	+3
Season matched	+2
Maintenance matched	+2
Occasion matched	+5
Gift For matched	+5

Example:

User:

Friend

Birthday

Friendship

Bedroom

Low Light

Snake Plant

Match	Score
Friend	5
Birthday	5
Bedroom	3
Low Light	3

Total = **16**

Money Plant

Match	Score
-------	-------

Friend 5

Birthday 5

Bedroom 0

Low Light 0

Total = **10**

Sort by score.

Show:

1. Snake Plant ★

Reason:

- ✓ Suitable for low light
- ✓ Ideal for bedroom
- ✓ Beginner friendly
- ✓ Perfect gift for friends

2. Money Plant ★

Reason:

- ✓ Symbolizes prosperity
 - ✓ Popular birthday gift
-

Step 6: Handle No Exact Match

Suppose user selects:

Purpose : Medicinal

Location : Bedroom

Light : Low

No plant matches.

Then:

Relax filters

Try:

Purpose + Location + Light

↓

Purpose + Location

↓

Purpose only

↓

Top Rated Plants

Never show:

No Plants Found

Always recommend something.

Step 7 (Recommended): Use Tags Instead of Multiple Columns

Instead of:

purpose1
purpose2
purpose3

Store:

```
{
  "purpose": ["Air Purification","Decoration"],

  "location": ["Bedroom","Living Room"],

  "light": ["Low","Medium"],

  "occasion": ["Birthday","Housewarming"],

  "gift_for": ["Friend","Colleague"],

  "maintenance":"Low"
}
```

This makes it easy to:

- Add new purposes
 - Add new occasions
 - Add new gift relations
 - Score recommendations
 - Integrate with chatbot later
-

Overall Flow

AI Recommendation

Buy or Gift ?

Ask Dynamic Questions

Filter Available Plants

Assign Scores

Sort by Score

Show Top 3 Plants

[Buy Now]

[Gift This Plant]

[Save to Wishlist]

[Ask AI More Questions]

This approach is simple to implement, works well for a shop with 50–500 plants, and can later be upgraded to an LLM-based chatbot without changing the core plant database.
